
ML | Credit Card Fraud Detection

Divyank Singh

Overview

The challenge is to recognize fraudulent credit card transactions so that the customers of credit card companies are not charged for items that they did not purchase.

Data Wrangling Report

1. As the data was obtained from kaggle therefore it was pretty clean data.

```
data = pd.read_csv('creditcard.csv')
```

```
data.shape
```

```
(284807, 31)
```

```
data.head().style.set_properties(**{"background-color":"black","color":"lawngreen"})
```

	Time	V1	V2	V3	V4	V5	V6	V7	V8	V9	V10	V11	V12	V13	
0	0.000000	-1.359807	-0.072781	2.536347	1.378155	-0.338321	0.462388	0.239599	0.098698	0.363787	0.090794	-0.551600	-0.617801	-0.991390	-0.311

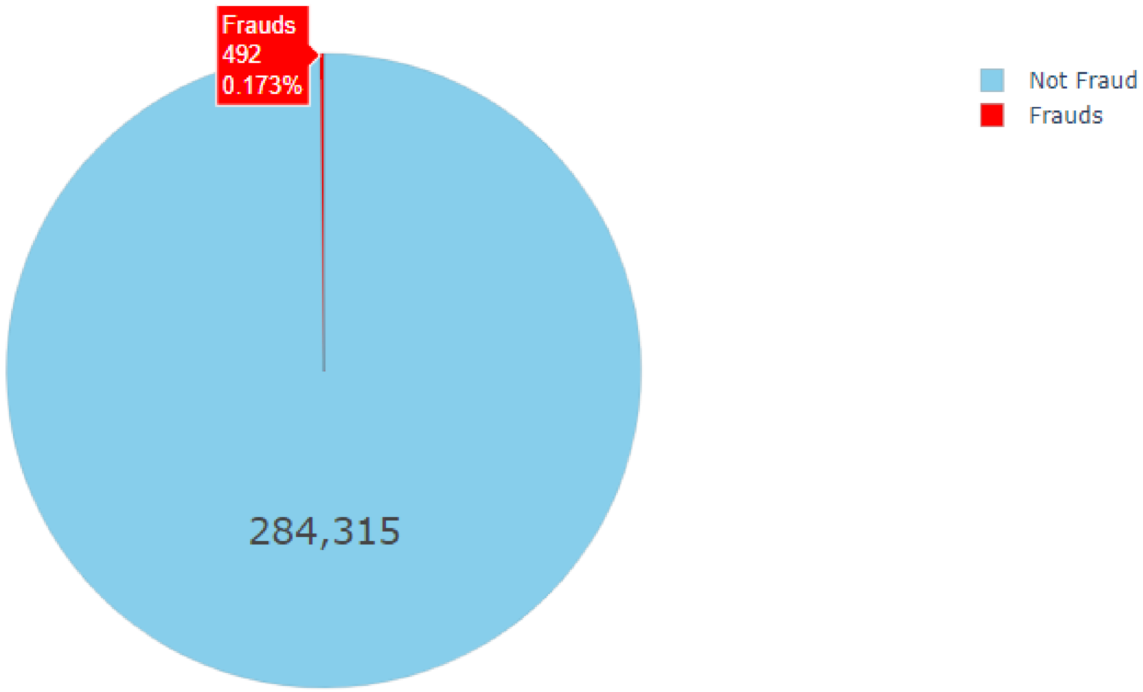
2. The dataset is **highly imbalanced** as only **492 transactions are fraud transaction out of 284807 transactions.**



3. Out of **492 fraud transactions** the mean amount turned out to be 122.21 and the maximum fraud transaction amount turned out to be 2125.87.

```
fraud.Amount.describe()
```

```
count     492.000000
mean      122.211321
std       256.683288
min         0.000000
25%         1.000000
50%         9.250000
75%       105.890000
max      2125.870000
Name: Amount, dtype: float64
```

4. Out of **284315 valid transactions** the mean amount turned out to be 88.29 and the maximum valid transaction amount turned out to be 25691.16.

```
normal.Amount.describe()
```

```
count    284315.000000
mean         88.291022
std         250.105092
min           0.000000
25%           5.650000
50%          22.000000
75%          77.050000
max       25691.160000
Name: Amount, dtype: float64
```

5. It did **not contain** neither null value nor missing value.

```
data.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 284807 entries, 0 to 284806
Data columns (total 31 columns):
 #   Column  Non-Null Count   Dtype  
---  ------  --------------   -----

 30  Class   284807 non-null  int64  
dtypes: float64(30), int64(1)
memory usage: 67.4 MB
```

6. The dataset does **contain** some extreme outlier, this was **verified by plotting** various graphs such as box plot graphs.
7. I also checked on whether the fraud transaction is more during specific period of time frame by plotting a scatter plot between “Time of transaction vs Amount by class” but that did not yield any clear result .

Class and Amount vs Time

```python
# We Will check Do fraudulent transactions occur more often during certain time frame ? Let us find out

f, (ax1, ax2) = plt.subplots(2, 1, sharex=True)
f.suptitle('Time of transaction vs Amount by class')
ax1.scatter(fraud.Time, fraud.Amount)
ax1.set_title('Fraud')
ax2.scatter(normal.Time, normal.Amount)
ax2.set_title('Normal')
plt.xlabel('Time (in Seconds)')
plt.ylabel('Amount')
plt.show()
```
